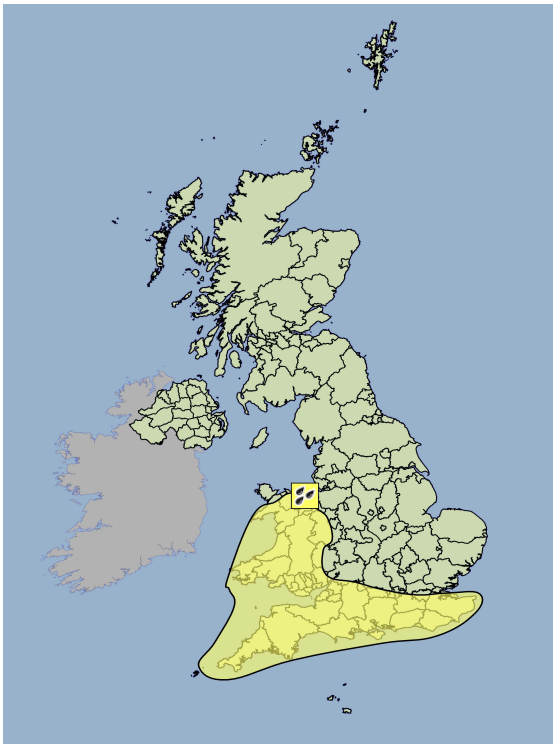
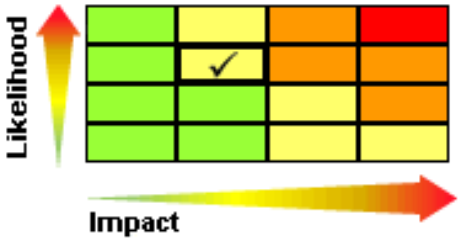
National Severe Weather Warning Service





Chief Forecasters Assessment
Another Atlantic low pressure system is expected to deepen significantly as it approaches the UK. The low pressure centre is likely to pass close to the extreme northwest of Scotland, whilst an active frontal system sweeps east across England and Wales. This system has the potential to produce 20-40 mm of rainfall quite widely in the warning area, with as much as 50-60 mm over higher ground in the west. These rainfall amounts are likely to lead to standing water and also the risk of localised flooding.

The Met Office have issued a **Yellow Warning** of **Rain**

Valid from **15:00 on Wed, 14th Jan 2015** until **09:00 on Thu, 15th Jan 2015**

A deepening area of low pressure is expected to move northeast passing close to the extreme northwest of Scotland on Thursday. A spell of heavy rainfall is expected across many parts of western and southern England and Wales in association with this system, lasting from Wednesday afternoon until Thursday morning, after which clearer, colder weather is expected to spread southeast.

The public should be aware of the risk of disruption to travel due to standing water and spray as well as localised flooding.
